Parallel input/output in high performance computing is a field of increasing . Distributed file systems like e.g. NFS, AFS, and DFS also use a set of devices.

We sketch the reasons for the I/O bottleneck in parallel and distributed systems, pointing out that it can be viewed as a special case of a general bottleneck that.

In Proceedings of Supercomputing '93, pages –, A parallel I/O system for high-performance distributed computing. B. Traversal, and P. Wong, "Overview of the MPI-IO Parallel I/O Interface," in Input /Output in Parallel and Distributed Computer Systems, R. Jain, J. Werth, and.

Parallel I/O, in the context of a computer, means the performance of multiple input/output operations at the same time, for instance simultaneously outputs to storage devices and display devices. It is a fundamental feature of operating systems. It is used for scientific computing and not for databases. It breaks up support into.

Many computations performed on parallel computers execute for extended periods. of computation state is essential in order to reduce the cost of system failures. The number of I/O requests depends partly on how data are distributed on.
