In physics, mainly quantum mechanics and particle physics, a spin magnetic moment is the Even though the neutron has a charge $q = 0$, its quarks give it a magnetic moment. $\mu_{S,z} = \gamma \hbar m_S$, while the (magnitude of the) total spin magnetic moment is, from (4), $\mu_S = \sqrt{3} \mu_B$, or approximately Bohr magnetons. In quantum mechanics, the expectation value is the probabilistic expected value of the result occurring (e.g. measurements which can only yield integer values may have a non-integer mean). It is a fundamental concept in all areas of quantum physics.

Quantum superposition is a fundamental principle of quantum mechanics. It states that, much like waves in classical physics, any two (or more) quantum states can .. If the particle has some probability for going from position x to y , and from z to y , a list of numbers at each value of n for the vector which has value q for the.
